

ABSTRACT OF THE DISCLOSURE

A process for producing a toner for developing electrostatic image is described, which involves an agglomerate step wherein a dispersion liquid containing at least primary polymer particles and colorant particles is stirred in a stirring tank to agglomerate the particles to thereby obtain agglomerate of the particles and an aging step wherein the resultant agglomerate of the particles is kept at a temperature higher than the glass transition temperature ( $T_g$ ) of the primary polymer particles by  $10^{\circ}\text{C}$  or more for a predetermined period of time to thereby fuse the particles, which process is characterized in that the concentration of solid content ( $C_1$ ) in the agglomerate step is 10 to 40% by weight, and that the concentration of the solid content ( $C_2$ ) in the aging step is in the range of  $0.3C_1 \leq C_2 \leq 0.8C_1$ .
